AI CALLING & TICKET LIFECYCLE

Clean Workflow Design — Complaint → Ticket → Action → Follow-up → Resolution → Closure

1. Primary Workflow

01	**OPERATOR CALLS AI** Operator calls the dedicated AI number to report any machine/vehicle complaint.
	▼
02	**AI COLLECTS UNIVERSAL DETAILS** Employee ID • Machine No. • Vehicle No. (if applicable) • Zone • Site • Date/Time • Complaint.
	▼
03	**AI IDENTIFIES THE PROBLEM** AI asks additional questions only when required based on the complaint.
	▼
04	**CREATE TICKET IN VERCELEX** Validated information is sent through the Vercelex API and the ticket is created.
	▼
05	**TICKET ASSIGNED** Vercelex routes the ticket to the relevant technical team/person.
	▼
06	**STATUS SYNCHRONIZED TO OUR PLATFORM** Ticket owner, status, last action, Job Card, parts and other available information are visible in our platform.
	▼
07	**AUTOMATION ENGINE CHECKS THE TICKET** The system checks status, pending action, ETA, SLA/condition and whether a follow-up call is required.
	▼
08	**AUTOMATIC AI FOLLOW-UP** If a configured condition is met, AI automatically calls the relevant person — engineer, store, operator or other stakeholder.
	▼
09	**RESPONSE IS RECORDED** AI captures the response, updates the workflow and schedules a reminder/follow-up when required.
	▼
10	**RESOLUTION VERIFICATION** When the technical work is expected to be complete, AI calls the operator/relevant person to confirm whether the original problem is actually resolved.
	▼
11	**DECISION** YES → proceed to closure. NO → keep ticket open and trigger the next configured action.
	▼
12	**TICKET CLOSURE** Closure status is synchronized and the complete lifecycle remains visible in our platform.

2. Post-Ticket Automation — Simple Logic

Ticket Created	→	**Technical Team Works**	→	**Status / Condition Reached**
Does this stage require a call?	→	**NO** Continue monitoring		**YES** Automatic AI Call

AI captures response	→	**Action complete?**	→	**Reminder / Next Action**
Resolution expected	→	**AI calls operator**	→	**Resolved?**
YES → Closure		**NO** → Ticket remains open		**Next configured action**

3. Automatic AI Call Scenarios

Trigger / Situation	Who AI Calls	What AI Collects	Next Action
Ticket assigned but action pending	Assigned engineer / team	Has work started? When can you take it up?	Update status / set ETA
Engineer is busy	Engineer	When will you be available?	Store ETA → schedule reminder
Engineer does not answer	Engineer	No response	Retry according to configured policy
Parts unavailable	Store / procurement	Availability, ETA, PO status	Update parts/PO → follow up
PO pending / delayed	Responsible stakeholder	PO status, issue, expected date	Update PO status → reminder
Job Card pending	Responsible person	Job Card status, progress, ETA	Update Job Card → reminder
Parts received	Engineer / technician	Ready to start?	Move to fitting/repair
Technical team says resolved	Operator	Is the original problem actually resolved?	Closure or keep open
Operator never reports resolution	Operator	Is the machine/vehicle working normally?	Confirm closure or follow up
Operator says not resolved	Operator / technical team	What remains unresolved?	Keep open → next action

4. What Our Platform Will Show After Vercelex API Integration

Ticket Information	Visible in Platform
Ticket ID / Status	Current Vercelex ticket number and status
Assigned To	Team / engineer currently responsible
Last Action	Latest activity performed on the ticket
Job Card	Job Card ID and current status
Parts	Available / unavailable / ordered / received
PO	PO status and expected date where available
Engineer	Assigned / busy / available / expected return
Next Action	What needs to happen next
Reminder	Next scheduled AI call / follow-up time
Resolution	Technical resolution + operator confirmation
Closure	Closed / pending / reopened

5. Example — Engineer Is Busy

1. Ticket is assigned to Engineer A.
2. Platform receives/reflects the assignment.
3. Configured condition says an action is pending.
4. AI automatically calls Engineer A.
5. Engineer says: “I am currently busy; I can attend at 4:00 PM.”
6. AI records the response and expected time.
7. Platform shows: Engineer Busy → Next Action 4:00 PM.
8. At the configured time, AI automatically calls again.
9. AI asks whether the engineer has completed/started the action.
10. Workflow continues based on the response.

6. Example — Operator Never Reports Resolution

1. Technical team marks the work as completed.
2. Platform receives the technical completion status.
3. The operator has not provided any confirmation.
4. The configured verification condition is reached.
5. AI automatically calls the operator.
6. AI asks whether the original machine/vehicle problem has been resolved.
7. YES → record confirmation and proceed with closure.
8. NO → keep ticket open, capture the issue and trigger the next configured action.

7. Core Automation Principle

Do not automate every call. Automate the decision of *when a call is needed*. The workflow engine checks the latest ticket status, owner, pending action, ETA, Job Card, parts status and resolution state. When an approved condition is met, it automatically initiates the appropriate AI call, records the response and determines the next action.

Target: Operator → AI → Vercelex → Technical Team → Status Sync → Workflow Decision → AI Follow-up/Reminder → Resolution Verification → Closure.
